

 atvise®

**Children feel at home here,
thanks to atvise®**

 T3 Tech

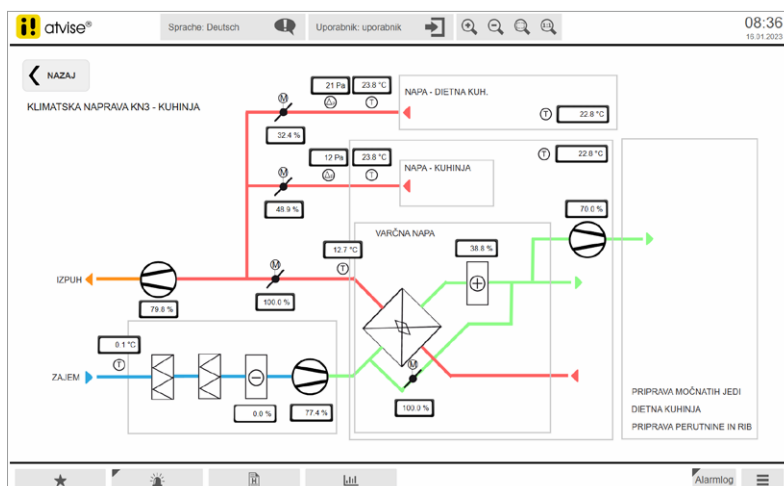

Happy children in a Ljubljana kindergarten, playing and laughing together. One reason for this is the perfect, optimally adjusted indoor climate.

Thanks to the professional implementation of the installations and the integration of intelligent building technology, the operator can control and effectively manage all relevant operating states of the building from a single point.

All energy-related aggregates, such as heating or cooling capacity, ventilation and current electricity, water and gas consumption, are displayed on a clearly structured dashboard. The implemented energy monitoring system also generates reliable diagrams via atvise® on consumption rates for specific periods with corresponding pricing. Using the Bachmann OT operating device and

the combined visualisation solution atvise® from Bachmann, the operator can now quickly make individual adjustments to the consumption services and thus actively influence the overall energy consumption of the nursery.

For our system integrator, not only the intuitive user interface of atvise® is important, but also the high system stability with the installed operating device. The simplicity and compactness of the systems also allows for fast and reliable on-site or remote support.
